An introduction to the modeling of business information systems, with processes formally modeled using Petri nets. This comprehensive introduction to modeling business-information systems focuses on business processes. It describes and demonstrates the formal modeling of processes in terms of Petri nets, using a well-established theory for capturing and analyzing models with concurrency. The precise semantics of this formal method offers a distinct advantage for modeling processes over the industrial modeling languages found in other books on the subject. Moreover, the simplicity and expressiveness of the Petri nets concept make it an ideal language for explaining foundational concepts and constructing exercises. After an overview of business information systems, the book introduces the modeling of processes in terms of classical Petri nets. This is then extended with data, time, and hierarchy to model all aspects of a process. Finally, the book explores analysis of Petri net models to detect design flaws and errors in the design process. The text, accessible to a broad audience of professionals and students, keeps technicalities to a minimum and offers numerous examples to illustrate the concepts covered. Exercises at different levels of difficulty make the book ideal for independent study or classroom use.

Students can now access their work from nearly

anywhere that has an Internet connection. In the case of collaborative research projects, this same technology allows team members to work with each other even when they are in different locations. A wide variety of online and offline tools, techniques, and tips to help students research, write, edit, prepare, and present term papers are discussed and explained here. This revelatory guidebook to the latest in term paper technology also supports Common Core Standards for the reading of technical accounts and texts.

ABSTRACT: Students use a myriad of disparate technologies and information sources to conduct a variety of activities during the research-paper writing process. While this process is considered a complex task, there is no information appliance that provides support. Using established frameworks of the research-paper writing process, an online survey was conducted to describe how activities, sources, and technologies used by students during the process are related to the various phases of that process. Connections were made between activities and technologies to show how an information appliance may support the process from onset to completion. Results show that the activities conducted during the process are iterative. The design application is that some technologies, such as those that support searching, need not be viewable at all times, but must always be available. These connections provide further insight into the student research-paper writing process and provide an example of how design may support task.
