occurred. Computer aided design, computer-aided manufacturing, flexible manufacturing systems, group technology and many others are considered by many manufacturing executives as the most promising technologies and philosophies that, if successfully implemented, can reduce costs and enable the US manufacturing companies to become more competitive in the global market. In the computer-integrated manufacturing environment, the decision processes are often more involved. The decision makers are

The reader will learn the physical fundamentals guiding the electrical and mechanical devices that allow for a modern automation and control system, which are widely comprised of computers, electronic instrumentation, communication loops, smart grids, and digital circuitry. It includes practical and technical data on electronic instrumentation with respect to efficiency, maximum power, and applications. Additionally, the text discusses fuzzy logic and neural networks and how they can be used in practice for electronic instrumentation of distributed generation, smart grids, and power systems.

This comprehensive textbook covers in detail the principal programmable automation technologies used in industry - the building blocks from which all automated manufacturing is developed. It is a one-stop source for developing CNC, robotics, and PLC programming skills, is replete with numerous examples, and it identifies and discusses readily available simulation software to experiment with. The text is

primarily intended for undergraduate engineering technology students. Besides, anyone with a technical background and a general understanding of manufacturing and manufacturing processes will find this text useful, as well as to those who wish, simply, to study and understand the use of these technologies The text is organized into four sections. Section One is introductory: Chapter 1 provides some background on manu-facturing and defines programmable automation. Chapter 2 explains calculation methods used to justify automation expenditures, as motivated by productivity concepts. Section Two covers computer numerical control: Chapter Chapter 3 introduces CNC technology, Chapter 4 discusses CNC programming, and Chapter 5 addresses CNC simulation. Robotics is covered in Section Three: Chapter 6

introduces robotics technology and Chapter 7 goes over both robotics programming and simulation. Section Four addresses PLCs: Chapter 8 introduces PLCs and Chapter 9 covers programming and simulation of PLCs. Finally, Chapter 10 concludes the text with a discussion of how all three technologies are brought together to create programmable automated workstations and work cells.
