This new edition of the 'all in one' textbook for the postgraduate study of valuation on real estate courses retains its focus on the valuation and appraisal of commercial and industrial property across investment, development and occupier markets. It is structured from the client perspective and covers single-asset pricing, risk and return issues. The structure of the book has been substantially revised. Part A introduces the key microeconomic principles, focussing on land as a resource, production functions, supply and demand and price determination. The locational aspect of real estate is also introduced. Macroeconomic considerations are categorised by the main market sectors (and their function); the market for land (development), for space (occupation) and for money (investment). The economic context is set and the author then explains why property valuations are required and discusses their main determinants of value and how they might be identified. The mathematics required to financially quantify value determinants are also introduced. Part B of the book describes the methods of valuation; Part C applies these methods to the valuation of a range of property types for a wide variety of purposes; and Part D covers investment and development appraisal. The author introduces valuation activities from a broad economic perspective, setting valuation in its business finance context and combining its academic and practical roots. Changes in this second edition include: less daunting economics expanded companion website with PowerPoint slides for lecturers, self-test Questions & Answers for students: see <http://www.wiley.com/go/wyattpropertyvaluation> 'www.wiley.com/go/wyattpropertyvaluation/a up-to-date case studies and sample valuations reference to the newly-published Red Book (the valuer's bible) Property Valuation with its user-friendly format, using tried-and-tested teaching and learning devices and a clear writing style, remains the core text for students on real estate, estate management and land economy degree courses, as well as for staff-track conversion courses for non-cognate graduates.

The third edition of Property Valuation: The Five Methods introduces students to the fundamental principles of property valuation theory by means of clear explanation and worked examples. An ideal text for those new to the subject, the book provides 1st year undergraduate students with a working knowledge and understanding of the five methods of valuation and the ways in which they are interlinked. In this fully revised edition, the new author team have: restructured the chapters to ensure a more logical order outlined the economic theory of value and the rules and constraints under which a valuer works provided detailed consideration of each of the five recognised approaches placed a larger emphasis on the Discounted Cash Flow approach These revisions are all written in the concise and accessible style which has made previous editions of the book so successful. The new edition of this textbook will be essential reading for undergraduates on all property, real estate, planning and built environment courses. Real Estate Valuation Theory is organized around five categories of intellectual contribution to the whole-appraiser decision making and valuation accuracy, application of nontraditional appraisal techniques such as regression and the minimum-variance grid method, appraising contaminated property, ad valorem tax assessment, and new perspectives on traditional appraisal methods. One common thread is that all of the papers are exceptionally well written and thought provoking. Valuation lies at the heart of much of what we do in finance, whether it is the study of market efficiency and questions about corporate governance or the comparison of different investment decision rules in capital budgeting. In this paper, we consider the theory and evidence on valuation approaches. We begin by surveying the literature on discounted cash flow valuation models, ranging from the first mentions of the dividend discount model to value stocks to the use of excess return models in more recent years. In the second part of the paper, we examine relative valuation models and, in particular, the use of multiples and comparables in valuation and evaluate whether relative valuation models yield more or less precise estimates of value than discounted cash flow models. In the final part of the paper, we set the stage for further research in valuation by noting the estimation challenges we face as companies globalize and become exposed to risk in multiple countries.

This book describes in full the major approaches used to evaluate investment in real estate and shows how theory informs decision-aid methods and tools to support such evaluation. The inclusion of numerous examples makes it also a practical guide to assessing the suitability of an investment property. The final chapters describe the valuation techniques and highlight their essential features, limitations and potential in relation to ability to manage the investment risk. The book is aimed at graduates who wish to deepen their study of the real estate market and of the methods used to support investment decisions in real estate but also at professionals and managers of companies operating in the real estate market.

**This monograph critically reviews and updates real estate valuation theory, which is based on neoclassical economics, in light of developments in heterodox economic theory. Building on a comprehensive historical account of the evolution of value theory, the book uses new institutional economics theory and critical realism as lenses through which problems in standard valuation theory and practice are expatiated, and as the foundation for an alternative theory. The new theory is employed to explain major problems in real estate valuation that are beyond the capability of the standard theory, such as price bubbles in real estate markets, anchoring bias, client influence and valuation under uncertain market conditions.**

Thoroughly revised and re-structured, it covers topics including risk, residential lease extensions, enfranchisement and cash flows. The text explain the theory concisely but at the same time seeks to show the application of different techniques in the contexts which are often encountered in practice. Detailed yet accessible, Property Valuation Techniques is ideal reading both for second and third year undergraduates; for postgraduates, both those new to the subject and those looking to extend their knowledge; and for practitioners who are not valuers but require some familiarity with the vocabulary, principles and application of the valuation toolkit or who are looking to refresh and develop their understanding of property valuation. New to this Edition: - Provides more material on sustainability in relation to property value - Revised and extended learning features and more worked examples to make the book even more user-friendly Resource-management decisions, especially in the area of protecting and maintaining biodiversity, are usually incremental, limited in time by the ability to forecast conditions and human needs, and the result of tradeoffs between conservation and other management goals. The individual decisions may not have a major effect but can have a cumulative major effect. Perspectives on Biodiversity reviews current understanding of the value of biodiversity and the methods that are useful in assessing that value in particular circumstances. It recommends and details a list of components-including diversity of species, genetic variability within and among species, distribution of species across the ecosystem, the aesthetic satisfaction derived from diversity, and the duty to preserve and protect biodiversity. The book also recommends that more information about the role of biodiversity in sustaining natural resources be gathered and summarized in ways useful to managers. Acknowledging that decisions about biodiversity are necessarily qualitative and change over time because of the nonmarket nature of so many of the values, the committee recommends periodic reviews of management decisions.

**The authors develop an equilibrium valuation model that incorporates optimal default to show how mortgage yields and lender recovery rates on defaulted mortgages depend on initial loan-to-value (LTV) ratios. The analysis treats both the frictionless case and the case in which borrowers and lenders incur deadweight costs upon default. The model is calibrated using data on California mortgages. Given reasonable parameter values, the model does a surprisingly good job fitting the risk premium in the data for high LTV mortgages. Thus, from an ex ante perspective, the authors do not find strong evidence of systematic underpricing of default risk in the run-up to the housing market crisis. Charts and tables.**
