in Europe and elsewhere, and a few measures - as yet untried by neuropsychology - that appear to be potentially useful for neuropsychological purposes. Thus, the third edition of Neuropsychological Assessment maintains its multipurpose functions as an authoritative textbook, reference work, and practitioner's manual.

Originally published in 1992, this is a wide-ranging text concerned with the principles and practice of neuropsychological assessment in adults. It combines a flexible hypothesis testing approach to assessment with information on specialised test batteries. The book covers the major areas of memory, language, perception, attention, and executive dysfunctions, and includes chapters

on dementia, alcohol, drug and toxic conditions, stroke and closed head injury. Assessment of dysfunction in cases involving claims for compensation and chapters on specialised assessment techniques, including automated test procedures, are provided. The book presents a sound introduction to this complex area and gives guidelines for the clinician who may need concise information on a specialised topic.

This book is intended for use in the elementary statistics course in Education or in Psychology. While it is primarily designed for use in the first semester of a two-semester course, it may also be used in a one-semester course. There are not five or ten competing texts; the number is much closer to fifty or a hundred. Why, then, should we

*write still another one? A new statistics text for use in Education and Psychology is, to some slight extent, comparable to a new translation or edition of the Bible. Most of it has been said before—but this time with a difference. The present writers realize that elementary statistics students know very little about the subject—even the meaning of *I* is all Greek to them. This text covers the basic course in depth, with examples using real data from the real world. It, of course, contains the usual reference tables and several new ones; it gives the appropriate formulas every time; and it accurately*

Psychometrics is a collection of papers that deals with the diverse developments contributing to the psychometrics of test design. Part I is a review of test design including practices being used in test development. Part II deals with design variables from a psychological theory that includes implications of verbal comprehension theories in the role of intelligence and the effects of these implications on goals, design, scoring, and validation of tests. Part III discusses the latent trait models for test design that have numerous advantages in problems involving item banking, test equating, and computerized adaptive testing. One paper explains the use of the

linear exponential model for psychometric models in speed test construction. The book discusses the traditional psychometric; the Hunt, Frost, and Lunnerbog theory; and the single-latency distribution model. Part IV examines test designs from the perspective of test developments in the future integrating technology, cognitive science, and psychometric theories. Psychologists, psychometricians, educators, and researchers in the field of human development studies will value this book.
