

Scope And Length Of June Papers

This volume contains the proceedings of TESTCOM/FATES 2008, a joint conference of two communities: TESTCOM was the 20th edition of the IFIP TC6/ WG6.1 International Conference on Testing of Communicating Systems and FATES was the 8th edition of the International Workshop on Formal Approaches to Testing of Software. TESTCOM/FATES 2008 was held at the Campus Innovation Center in Tokyo, Japan during June 10-13, 2008. Testing is one of the most important techniques for validating and checking the correctness of communication and software systems. Testing, however, is also a laborious and very cost-intensive task during the development process of such systems. TESTCOM is a series of international conferences addressing the problems of testing communicating systems, including communication protocols, services, distributed platforms, and middleware. FATES is a series of international workshops discussing the challenges of using rigorous and formal methods for testing software systems in general. TESTCOM/FATES aims at being a forum for researchers, developers, and testers to review, discuss, and learn about new approaches, concepts, theories, methodologies, tools, and experiences in the field of testing of communicating systems and software. TESTCOM has a long history. Previously it was called the International Workshop on Protocol Test Systems (IWPPTS) and changed its name to the International Workshop on Testing of Communicating Systems (IWTCS) later. The previous conferences were held in Vancouver, Canada (1988); Berlin, Germany (1989); McLean, USA (1990); Leidschendam, The Netherlands (1991); Montr eal, Canada (1992); Pau, France (1993); Tokyo, Japan (1994); Evry, France (1995); Darmstadt, Germany (1996); Cheju Island, Korea (1997); Tomsk, Russia (1998); Budapest, Hungary (1999); Ottawa, Canada (2000); Berlin, Germany (2001); Sophia Antipolis, France (2002); Oxford, UK (2004); Montr eal, Canada (2005); New York, USA (2006) and Tallinn, Estonia (2007).

In summer in the southern part of the Baltic a well defined sound channel exists caused by a thermal gradient in fresh run off water overlying relatively warm saline bottom water from the North Sea. We have analyzed acoustic transmission loss at 100 Hz, 3.5 kHz and 8.0 kHz and dispersion over a range of 20 Hz to 4 kHz. Measurements in three different areas indicate channeling of the sound, restricted closer to the channel axis at the two higher frequencies, and the transmission loss is independent of the shape of the sound channel. For source and receiver on the axis of the sound channel, transmission loss at 10 km and 3.5 kHz is generally about 40 db less than that where neither source nor receiver is near the axis. (Author).
