The emphasis on self-assessment is designed to make learning easier and more enjoyable. The structure of the book is:

Michael Baum was inspired by his experiences living in Israel and working on the archeological excavation of Masada, and draws on his family history of breast cancer and his Ashkenazi heritage in The Third Tablet of the Holy Covenant. He skilfully blends the molecular and biblical genealogy of the Jewish people with the fletitious search for an ancient relic to produce a gripping semi-autobiographical novel. The story follows Martin Tanner, who grows up in a poor Jewish family in the East End of London during the Second World War. A brilliant student, he goes on to qualify as a surgeon at University College London, learning along the way that his family is cursed with the Ashkenazi mutation, a defect in the DNA coding that leads to an increased risk of cancer. Martin is faced with his trials, including his mother undergoing a radical mastectomy and her subsequent suicide whilst he is serving in the RAMC during the Suez crisis. He immigrates to Israel in 1960 and serves as medical officer on the Masada dig in 1963 where he meets and falls in love with Sara, a nurse who suffers the same fate as his mother. The tragedy of Martin’s life is coupled with the discovery of the ‘Eliizer Scroll’ on the dig, which provides evidence that a codicil to the Mosaic tablets of the holy covenant could exist. The translation of these scrolls reveals that twin sisters escaped from the sacking of Jerusalem in 70 CE, carrying with them holy relics from the Temple... This book combines the quest for a biblical relic from the second Temple in Jerusalem, with the biblical and genetic anthropology of the Jewish people. Michael Baum uses passages of humour mixed with pathos, jogging along with the pace of a detective story.

In the management of vascular disease, there has been an inexorable drive towards less invasive endovascular treatment options. Endovascular treatment of carotid stenosis for stroke is no exception. Several sizeable multicentre trials are running concurrently, which are comparing carotid endarterectomy (CEA), the “gold standard,” with the less invasive alternative, carotid stenting (CAS) for low-risk patients with symptomatic carotid stenoses who are considered to be surgical candidates. The endovascular option is in itself a newcomer but state-of-the-art CAS with regards use of all the available technical refinements, to include low-profile monoarid dedicated systems with contemporary pharmacological support, is perhaps all but five years old. There is considerable interest from clinicians from a variety of clinical backgrounds and from industry in this technique and, therefore, scope for a contemporary practical guide.

Medical students lack information on preparing for clinical surgical finals, particularly on common mistakes and the features which identify successful candidates. The Ultimate Guide to Passing Surgical Clinical Finals is an accessible and comprehensive preparation aid, equipping final year medical students with the knowledge and skills that they are expected to demonstrate both in clinical surgical finals and in clinical practice as junior doctors. Its tutorial-style approach provides advice on how to think logically, speak coherently, and demonstrate both breadth and depth of knowledge - all key hallmarks of successful candidates. The book’s broad approach reflects the full range of skills and knowledge covered by modern curricula, including instruments, procedures and the increasing use of surgical imaging. It is vital reading for clinical year medical students preparing for final examinations in surgery, and for postgraduate students who wish to improve their presentation, viva and OSCE clinical examination skills. This book’s approach is in the best surgical traditions of ordered thinking when it comes to the examination itself. I admire this book and commend it to you.’ - From the Foreword by David E Khoo

As the first in the ‘Clinical Talk’ series, the philosophy of this book is to have a set of question-based sections to help a final-year medical student prepare for exams. These sections include multiple choice questions (MCQs), extended matching questions (EMQs) and case studies. The idea is to have not just a ‘test yourself’ book, but one which students can work through as a learning exercise as well as for revision purposes.

For that reason, the answers and explanations provided here are just as important as the questions themselves.Stansby and Goldberg have structured this book such that it complements one of their bestselling textbooks, Surgical Talk: Revision in Surgery.

The book describes what goes on behind the scenes in undergraduate and postgraduate medical education, scientific research and general medical practice in the United Kingdom. It covers the years 1945 to 2012 and is an account of a unique medical journey. The author was brought up by parents who were general practitioners in Yorkshire. His upbringing was thoroughly middle class and his observations of his parents work and lifestyle resulted in his wanting to be a doctor. Medical student life at University College London was hard work. Several of his teachers were eminent and world famous. Two of them were Profressors J Z Young (anatomy) and Andrew Huxley (Physiology and Nobel Prize winner). Life-long friendships were made with fellow students who worked together dissecting a human body. Experiments were performed on one another.

The social life in the 1960s of a group of medical student friends is described. Studying octopuses and squid in Naples, Italy. Was part of an extra degree course which was undertaken before starting hospital clinical studies? These were at The London Hospital, Whitechapel, in the east end of London. There was so much to learn before being allowed to practice as a doctor. Clinical studies were undertaken at The London Hospital, Whitechapel. This is one of the oldest hospitals in the UK. There is a huge learning curve which resulted in a doctor just about able to deal with patients. A year of pre-registration work started on the medical wards at Mile End Hospital followed by a period in the Receiving Room (Accident and Emergency Department) at The London Hospital. The pre-registration house jobs sometimes involved working 100 hours a week. Nights in the accident emergency department were manned by one pre-registration house officer and a nurse. There is a description of what is involved undertaking research to PhD level in physiology. A new clinical thermometer was designed, tested and eventually manufactured and sold by the instrument developer Muirhead Ltd. So soon after being a student, the wheels had turned and the author was teaching students himself. There is an account of starting work as a General Practitioner in Cheltenham having not seen a single patient for the previous three years. After that he worked for a short time in a London practice and then in Castleford, West Yorkshire from 1978 to 2005. He and his wife build the practice up from a zero base to a thriving training practice housed in a large modern clinic. Doing this was financially risky as well as stressful. The development of postgraduate general practice education in Yorkshire in the last two decades of the twentieth century is described. There are descriptions of becoming a trainer of prospective GPs and then organising and managing trainers. The role of a GP tutor in the education of GPs was undertaken as a specific job. Work on the assessment of the competence of trainee GPs was overseen in the Yorkshire Danery, based in Leeds, West Yorkshire. Work on the monitoring of the GP contract with the NHS and the GP appraisal scheme was undertaken by NHS Wakefield district, a Primary Care Trust. The author worked for both these bodies and what was involved in GP appraisal and inspection of practices’ target achievements is examined in detail. Work with ill and underperforming general practitioners is described as well as mentoring GPs with problems and worries. Very few patient problems and cases are included in this book which rather tells of the work that went on in the background. It is that work that produces high quality doctors and also year on year improvement in patient care. The last chapter involved informal interviews in 2012 with people studying and working in the same fields experienced over the years by the author and outlined above. Readers are asked to judge whether the present day situation is an improvement on

As finals approach, medical students often become overwhelmed by the sheer volume of knowledge required to pass all subjects in one go, including surgery, medicine, obstetrics and gynaecology, pharmacology and psychiatry. Clearly the students cannot know each of these subjects in as much detail as they did during their individual attachments and they need to concentrate on important topics rather than minutiae. Whereas existing textbooks cover many topics very well and in great detail, they are lengthy and difficult to read in a short space of time; also some subjects are poorly covered and give no real understanding of practical management and logical thought processes – the exact requirements for passing finals. Surgical Talk: Surgery for Finals is specifically aimed at helping students pass the surgical final examination; it concentrates on subjects and concepts that tend to confuse students. Each chapter is like a tutorial, providing tips on what to say and when to say it and more importantly a logical approach to answering questions. The book deals with topics poorly covered elsewhere, such as fluid balance, total parenteral nutrition, central lines, drains and surgical antibiotics. It also has comprehensive chapters on orthopaedics and urology. The reader will feel as though they are being taught one to one.

This book is an informed, educational and abundantly illustrated guide to the imaging knowledge that medical students in the clinical years of their undergraduate studies will be required to get to know, understand and recall in order to negotiate successfully their finals exams. Via the popular and instructive case-based format, readers are guided through 100 cases chosen specifically to reflect what the authors consider is necessary knowledge for finals, and imaging modalities that students can reasonably expect to encounter with a resulting emphasis on plain film with some CT and MR.

Now a major motion picture starring Cole Sprouse and Haley Lu Richardson! Goodreads Choice Winner, Best Young Adult Fiction of 2019 In this #1 New York Times bestselling novel that’s perfect for fans of John Green’s The Fault in Our Stars, two teens fall in love with just one minor complication—they can’t get within a few feet of each other without risking their lives. Can you love someone you can never touch? Stella Grant likes to be in control—even though her totally out of control lungs have sent her in and out of the hospital most of her life. At this point, what Stella needs to control most is keeping herself away from anyone or anything that might pass along an infection and jeopardize the possibility of a lung transplant. Six feet apart. No exceptions. Will Newman wants to be in control of his hospital. He couldn’t care less about his treatments, or a fancy new clinical drug trial. Soon, he’ll turn eighteen and then he’ll be able to unplug all these machines and actually go see the world, not just its hospitals. Will’s exactly what Stella needs to stay away from. If he so much as breathes on Stella she could lose her spot on the transplant list. Either one of them could die. The only way to stay alive is to stay apart. But suddenly six feet doesn’t feel like safety. It feels like punishment. What if they could steal back just a little bit of the space their broken lungs have stolen from them? Would five feet apart really be so dangerous if it stops their hearts from breaking too?

HISTORY OF BRITISH NEUROLOGY by F Clifford Rose (Imperial College School of Medicine, UK) Diseases of the nervous system are a relatively small but vitally important part of medicine. There was no scientific basis for diagnosis or treatment until the seventeenth century when Dr Thomas Willis (1621/1675) and his team tackled anatomy by dissection of the nervous system, physiology by animal experiments and pathology by post-mortem analysis. It was Willis who first used the word “neurology” and his team, who were among the founders of the Royal Society, included Christopher Wren who, besides being famous as an architect of London’s churches, drew the first modern diagram of the human brain. Developments in our knowledge of the nervous system in the following centuries, and the unique importance of clinical neurology, became globally recognised through the work of Whytt, Heberden, Hughlins Jackson, Gowers and many others. The work and discoveries of these eminent specialists were extended with the introduction of such neurosciences as neurophysiology, neuropathology and neuro-radiology, and this is the first comprehensive account of a battle with the unknown by determined practitioners.

Lecture Notes on General Surgery

A case-based guide

This textbook is an introduction and guide to undergraduate surgery. It has been a bestseller since its first edition in 2001. The philosophy of this book is to focus on the level of knowledge and the approach that would be expected of the better students reaching the end of their undergraduate training. Avoiding a book that is too cumbersome, we have tried to make this volume readable and enjoyable, using various techniques to help the reader remember key facts: the text has been deliberately written in a tutorial-like story format as opposed to a set of lists, since this makes it easier to understand and remember. In addition to general surgery, the book contains sections on trauma, orthopaedics, urology and ENT, making it the only comprehensive textbook for medical students wishing to learn top tips in surgery. Subjects that are poorly covered in other main texts — such as fluid balance management and minor surgical procedures — are dealt with in a tutorial fashion in this book, and there is a section on how to problem-solve even in the context of areas unknown to the student. This book is useful for medical students and also for junior doctors during their day-to-day work on wards, as well as those coming up to postgraduate exams. Each chapter is written by an authoritative author, alongside the book editors, and they have ensured it remains in the spirit of the bestselling previous editions. Foreword Foreword (31 KB)

Single Best Answers in Surgery offers a new approach to revising for surgical finals; by not only indicating the correct answer to each question, but explaining the full rationale used for finding the answer in each case. The enthusiastic feedback received from readers of the international bestseller Schein’s Common Sense Experience Abdominal Surgery now in its 3rd edition, translated to seven languages; Springer Verlag; ISBN 9783540748205 inspired the editors to do a similar book dedicated to surgical complications: practical, non-formal, internationally relevant (in all types of practice and levels of hospitals) – and definitely not politically correct: what is considered taboo by others is not taboo for us; here we discuss everything! As in the editors’ previous book, the use of references is restricted to the absolute minimum, and citing figures and percentages is avoided as much as possible. The chapters in this book are the opinion of experts – each contributor has a vast personal knowledge and clinical experience in the field he is writing about. This book will help all surgeons (and their patients), avoid the misery of complications, and will provide advice on the management of those that are unavoidable. Complications and death are an integral component of surgery. Surgeons have to look death in the eyes, try to prevent it and vanquish it – this is what this book is all about. “Schein’s books are always terrific reads, conveying witty observations and practical advice and doing so with wit and scholarship. This latest is surely a must for every surgeon’s bookshelf.” Abraham Verghese MD, author of CUTTING FOR STONE
