The Korean Peninsula, which constitutes one of the strategic pivots of Northeast Asian security, has remained a contested theatre for major powers. Denuclearisation of the Peninsula is unfolding as one of the most defining challenges in shaping regional security. The end state in the

Peninsula and how it is to be realised is debated amongst the stakeholders. This book aims to situate some of the critical issues in the Korean theatre within the competing geopolitical interests, strategic choices and policy debates among the major powers. This volume is an endeavour to bring together leading Indian experts including former Indian ambassadors to the Republic of Korea, senior members from the defence and strategic community to analyse the developing situation in the Korean Peninsula.

?The Korean Peninsula has remained a

contested theatre for the major powers. Brutal wars have been fought involving imperial Japan, Czarist Russia, the Union of the Soviet Socialist Republics (USSR), Qing China, the People's Republic of China, and the United States (US) which left the Peninsula conquered, colonised, and divided, starting with Chosun (Yi) Korea from 1392-1910 to colonial Korea from 1910-45 to divided Korea since 1945.<sup>1</sup> Subsequently, the Korean War from 1950-53 defined the character of the Cold War in Northeast Asia. The strategic choices in the Korean theatre have been

influenced by the competing geopolitical interests of regional stakeholders. In the post-Cold War era, the Peninsula remained a key variable in shaping the Northeast Asian security architecture since the Democratic People's Republic of Korea or North Korea continued to employ the strategic use of nuclear brinksmanship.

MacOS High Sierra: The Missing Manual

**This book illustrates applications of mathematics to various processes (physiological or artificial) involving flowing blood, including hemorheology, microcirculation, coagulation, kidney filtration and dialysis, offering a historical overview of each topic. Mathematical models are used to simulate processes normally occurring in flowing blood and to predict the effects of dysfunctions (e.g. bleeding disorders, renal failure), as well as the effects of therapies with an eye to improving treatments. Most of the models have a completely new approach that makes patient-specific simulations possible. The book is mainly**

Regulatory Commission and the Department of Homeland Security sponsored a National Academies study to assess the safety and security risks of spent nuclear fuel stored in cooling pools and dry casks at commercial nuclear power plants. The information provided in this book examines the risks of terrorist attacks using these materials for a radiological dispersal device. Safety and Security of Commercial Spent Nuclear Fuel is an unclassified public summary of a more detailed classified book. The book finds that successful terrorist attacks on spent fuel pools, though difficult, are possible. A

propagating fire in a pool could release large amounts of radioactive material, but rearranging spent fuel in the pool during storage and providing emergency water spray systems would reduce the likelihood of a propagating fire even under severe damage conditions. The book suggests that additional studies are needed to better understand these risks. Although dry casks have advantages over cooling pools, pools are necessary at all operating nuclear power plants to store at least the recently discharged fuel. The book explains it would be difficult for terrorists to steal enough spent fuel to

construct a significant radiological dispersal device. Over the last years, Unmanned Aerial Vehicles (UAVs) have gradually become a more efficient alternative to manned aircraft, and at present, they are being deployed in a broad spectrum of both military as well as civilian missions. This has led to an unprecedented market expansion with new challenges for the aeronautical industry, and as a result, it has created a need to implement the latest design tools in order to achieve faster idea-to-market times and higher product performance. As a complex engineering product, UAVs are comprised of

numerous sub-systems with intricate synergies and hidden dependencies. To this end, Multidisciplinary Design Optimization (MDO) is a method that can identify systems with better performance through the concurrent consideration of several engineering disciplines under a common framework.

Nevertheless, there are still many limitations in MDO, and to this date, some of the most critical gaps can be found in the disciplinary modeling, in the analysis capabilities, and in the organizational integration of the method. As an aeronautical product, UAVs are also expected to work together

with other systems and to perform in various operating environments. In this respect, System of Systems (SoS) models enable the exploration of design interactions in various missions, and hence, they allow decision makers to identify capabilities that are beyond those of each individual system. As expected, this significantly more complex formulation raises new challenges regarding the decomposition of the problem, while at the same time, it sets further requirements in terms of analyses and mission simulation. In this light, this thesis focuses on the design optimization of UAVs by enhancing the

current MDO capabilities and by exploring the use of SoS models. Two literature reviews serve as the basis for identifying the gaps and trends in the field, and in turn, five case studies try to address them by proposing a set of expansions. On the whole, the problem is approached from a technical as well as an organizational point of view, and thus, this research aims to propose solutions that can lead to better performance and that are also meaningful to the Product Development Process (PDP). Having established the above foundation, this work delves firstly into MDO, and more specifically, it presents a

framework that has been enhanced with further system models and analysis capabilities, efficient computing solutions, and data visualization tools. At a secondary level, this work addresses the topic of SoS, and in particular, it presents a multi-level decomposition strategy, multi-fidelity disciplinary models, and a mission simulation module. Overall, this thesis presents quantitative data which aim to illustrate the benefits of design optimization on the performance of UAVs, and it concludes with a qualitative assessment of the effects that the proposed methods and tools can have on both the
