

Temperament And Character Of The Arabs

Personality and National Character analyses the underlying factors that contribute to the national character of a people from the point of view of modern psychology. The book focuses mainly in the manifestations of the level of anxiety. Chapters discuss such topics as anxiety and psychosis; suicide and alcoholism; the relation between anxiety and sex; anxiety and economic growth; climatic effects on anxiety; and anxiety and race. Psychiatrists, sociologists, economists, psychologists, and educators will find the book invaluable.

Created for Greatness explains the virtue of magnanimity, a virtue capable of setting the tone of your entire life, transforming it, giving it new meaning and leading to the flourishing of your personality. Magnanimity is the willingness to undertake great tasks; it is the source of human greatness. Along with humility, it is a virtue specific to true leaders emboldened by the desire to achieve greatness by bringing out the greatness in others. Complete with practical steps and points for personal examination, this book will not only inspire you, but will place you firmly on the path to a more magnanimous life.

Temper and Temperament; or Varieties of character

"Character" has become a front-and-center topic in contemporary discourse, but this term does not have a fixed meaning. Character may be simply defined by what someone does not do, but a more active and thorough definition is necessary, one that addresses certain vital questions. Is character a singular characteristic of an individual, or is it composed of different aspects? Does character--however we define it--exist in degrees, or is it simply something one happens to have? How can character be developed? Can it be learned? Relatedly, can it be taught, and who might be the most effective teacher? What roles are played by family, schools, the media, religion, and the larger culture? This groundbreaking handbook of character strengths and virtues is the first progress report from a prestigious group of researchers who have undertaken the systematic classification and measurement of widely valued positive traits. They approach good character in terms of separate strengths--authenticity, persistence, kindness, gratitude, hope, humor, and so on--each of which exists in degrees. Character Strengths and Virtues classifies twenty-four specific strengths under six broad virtues that consistently emerge across history and culture: wisdom, courage, humanity, justice, temperance, and transcendence. Each strength is thoroughly examined in its own chapter, with special attention to its meaning, explanation, measurement, causes, correlates, consequences, and development across the life span, as well as to strategies for its deliberate cultivation. This book demands the attention of anyone interested in psychology and what it can teach about the good life.

Temperament and Character Correlates of the Startle Reflex

With a Survey of Temperament

This study investigates individual temperament and character effects on bidding behavior in a first-price sealed-bid auction with independent private value frameworks. Preceding studies on experimental first-price auctions reported that selection biases, such as risk attitude (Cox et al. 1988), gender (Ham and Kagel, 2006), sex hormone cycle (Chen et al. 2013; Pearson and Schipper, 2013), cause positive and negative effects on bidding behavior. The present study applied a psychological personality trait, Temperament Character Inventory (TCI), to analyze whether individual personality affects bidding behavior. The experimental results show that Novelty Seeking (NS) significantly decreases bids and Harm Avoidance (HA) significantly increases bids. Furthermore, cross term of elicited risk preferences and NS have significant effect on bidding behavior.

Neuroimaging Personality, Social Cognition, and Character covers the science of combining brain imaging with other analytical techniques for use in understanding cognition, behavior, consciousness, memory, language, visual perception, emotional control, and other human attributes. Multidimensional brain imaging research has led to a greater understanding of character traits such as honesty, generosity, truthfulness, and foresight previously unachieved by quantitative mapping. This book summarizes the latest brain imaging research pertaining to character with structural and functional human brain imaging in both normal individuals and those with brain disease or disorder, including psychiatric disorders. By reviewing and synthesizing the latest structural and functional brain imaging research related to character, this book situates itself into the larger framework of cognitive neuroscience, psychiatric neuroimaging, related fields of research, and a wide range of academic fields, such as politics, psychology, medicine, education, law, and religion. Provides a novel innovative reference on the emerging use of neuroimaging to reveal the biological substrates of character, such as optimism, honesty, generosity, and others Features chapters from leading physicians and researchers in the field Contains full-color text that includes both an overview of multiple disciplines and a detailed review of modern neuroimaging tools as they are applied to study human character Presents an integrative volume with far-reaching implications for guiding future imaging research in the social, psychological and medical sciences, and for applying these findings to a wide range of non-clinical disciplines such as law, politics, and religion Connects brain structure and function to human character and integrates modern neuroimaging techniques and other research methods for this purpose

Temper and Temperament

Human Temperaments

Character plays a central role in our everyday understanding and evaluation of ourselves and one another. It informs the expectations that ground our plans and projects, our moral responses to other people's behaviour and to opportunities we ourselves face, and our political decisions concerning formal education, criminal punishment, and other aspects of social organisation. The very idea that people have persisting character traits that explain their behaviour is woven throughout the fabric of our culture. These philosophical essays clarify this idea of character, analyse its relation with the findings of experimental psychology, and draw out the implications of this for education and for criminal punishment. They bring together a range of issues in contemporary philosophy, including the nature of agency, the modelling of behavioural cognition, ethical implications of personal necessity, moral responsibility for implicit bias, the prospects for character education, and the nature of rightful criminal punishment. The essays emphasise that character is inherently dynamic, challenging the tendency among personality psychologists and virtue ethicists alike to focus on static snapshots of traits, and they emphasise the close integration of character with the individual's social context, seeking to accommodate the situationist experimental findings within a picture of behaviour as manifesting stable character traits. The volume is intended to demonstrate the deep conceptual affinity of moral philosophy and social psychology and the consequent potential for each to benefit from the other.

Describes sixteen basic personality types, argues that people try to reshape their spouses, children, friends, and coworkers into models of themselves, and discusses different styles of leadership

Temperament, Character, and Personality

On Becoming a Virtuous Leader

With a Survey of Personality in General

A Contribution to the Psychology of Temperament and Character

This is a new release of the original 1927 edition.

Drawing on the lives of some of the greatest political, intellectual and religious leaders of modern times, and the author's personal experience, Virtuous Leadership demonstrates that leadership and virtue are not only compatible, they are actually synonymous. Virtuous Leadership defines each of the classical human virtues most essential to leadership – magnanimity, humility, prudence, courage, self-control and justice. It demonstrates how these virtues promote personal transformation and the attainment of self-fulfillment. It also considers the Christian supernatural virtues of faith, hope and charity without which no study of leadership can be complete. The book's final section, Towards Victory, offers a methodology for the achievement of interior growth tailored to the needs of busy, professional people intent on imbuing their lives with a transcendent purpose. Thus, the aim of Virtuous Leadership is ultimately practical. It is meant to be your guidebook in the quest for excellence.

The Psychology of Character

Objectives: To investigate the association between temperament/character and mood state.Background and aims: Although it is difficult to delineate a boundary between temperament/character and mood state, it is important to know which temperament/character may be particularly associated with mood state. In the present study, I investigated the association between temperament and character scores measured by TEMPS-A and Temperament and Character Inventory (TCI) and mood state scores measured by Hamilton Depression Rating Scale (HDRS) and Young Mania Rating Scale (YMRS). Materials and methods: Using our database, the data of 111 healthy subjects with both TCI, TEMPS-A, HDRS and YMRS scores were secondarily used for the present study. The study population comprised 67 men and 44 women, with a mean age of 26.3 years (range, 20u201342 years). The association of temperament scores of the TEMPS-A, TCI, and mood state scores was analyzed by the Pearson correlation coefficient.Results: HDRS (i.e., depressive) scores were significantly and positively associated with depressive, anxious, and irritable temperament scores of TEMPS-A and harm avoidance scores of TCI whereas HDRS scores were significantly and negatively associated with self-directedness scores of TCI. YMRS (i.e., manic) scores were not associated with any item scores of TEMPS-A or TCI.Conclusions: The preset findings suggest that in particular, depressive, anxious, and irritable temperament and harm avoidance may be positively associated with depressive state whereas self-directedness may be negatively associated with depressive state. These findings should be borne in mind when considering the scores of TEMPS-A and/or TCI.

Psychologists Assess the Presidents

This is a provocative contribution to contemporary ethical theory challenging foundational conceptions of character.

Despite emergent attempts to connect temperament to a neurobiological etiology there has been little research that focuses on the relationship between temperament and character and neuropsychological test performance. Therefore, the aim of this study is to explore the relationship between temperament, character and performance on neuropsychological tests of executive functioning. Temperament and character dimensions were operationalized according to the Temperament and Character Inventory (TCI), a 240-item measure that is based on the psychobiological theory of personality. Neuropsychological performance was measured on the University of Pennsylvania Computerized Neuropsychological Test Battery (PennCNP), which is a test of executive functioning and abstract reasoning. The PennCNP comprised a test of Motor Praxis (MPRAXIS), the Penn Abstraction, Inhibition and Working Memory Task (AIM), the Letter-N-Back (LNB2), the Penn Conditional Exclusion Task (PCET), the Penn Short Logical Reasoning Task (SPVRT) and the Short Raven's Progressive Matrices (SRAVEN). The sample comprised 422 first year psychology students at a residential university in South Africa. The results from this explorative study showed a moderate relationship between temperament, character and executive functioning. The temperament dimensions Novelty Seeking and Reward Dependence were positively related to AIM-NM, AIM and SPVRT, and inversely related to MPRAXIS. These results validate the importance of research that investigates the relationship between temperament and character dimensions and neuropsychological performance.
