It was spring on the Llano Estacado, the Staked Plains of Texas, the time for the cattle drives to push north to the rail heads in Kansas. The "Lost Cause" of the South was still fresh in the mind of Southerners, including fifty-five-year-old Ben Albright, a pioneer of the Texas cattle drives, who was well familiar with the trail and its dangers--he had successfully made five cattle drives from Texas to Kansas, but this spring will be his most difficult. With the death of Ewell Lansing, Northerners have taken over his trading post and ferry and refused provisions or passage to Texas cattle drives. When Albright finds a way around this, tensions reach the breaking point, and a Northerner and his horse are found dead. Will the Texans be able to prove their innocence before the Northerners catch up to them?

The domain of nonlinear dynamical systems and its mathematical underpinnings has been developing exponentially for a century, the last 35 years seeing an outpouring of new ideas and applications and a concomitant confluence with ideas of complex systems and their applications from irreversible thermodynamics. A few examples are in meteorology, ecological dynamics, and social and economic dynamics. These new ideas have profound implications for our understanding and practice in domains involving complexity, predictability and determinism, equilibrium, control, planning, individuality, responsibility and so on. Our intention is to draw together in this volume, we believe for the first time, a comprehensive picture of the manifold philosophically interesting impacts of recent developments in understanding nonlinear systems and the unique aspects of their complexity. The book will focus specifically on the philosophical concepts, principles, judgments and problems distinctly raised by work in the domain of complex nonlinear dynamical systems, especially in recent years. -Comprehensive coverage of all main theories in the philosophy of Complex Systems -Clearly written expositions of fundamental ideas and concepts -Definitive discussions by leading researchers in the field -Summaries of leading-edge research in related fields are also included

The Time the Flying Car and Inventions Around Us

A classic! First time in digital format! This is the story of the most incredible mission of World War II, born in desperation and carried out with foolhardy courage and at the cost of brave men's lives: Mission Aphrodite! A real-life, aerial Guns of Navarone scheme that called for volunteers to guide B-17 drone planes packed with explosives into the Nazi V-2 rocket bases. The mission that cost Joe Kennedy, Jr., his life. The award-winning author of thirty-three books, Jack Olsen's books have published in fifteen countries and eleven languages. Olsen's journalism earned the National Headliners Award, Chicago Newspaper Guild's Page One Award, commendations from Columbia and Indiana Universities, the Washington State Governor's Award, the Scripps-Howard Award and other honors. He was listed in Who's Who in America since 1968 and in Who's Who in the World since 1987. The Philadelphia Inquirer described him as "an American treasure." Olsen was described as "the dean of true crime authors" by the Washington Post and the New York Daily News and "the master of true crime" by the Detroit Free Press and Newsday. Publishers Weekly called him "the best true crime writer around." His studies of crime are required reading in university criminology courses and have been cited in the New York Times Notable Books of the Year. In a page-one review, the Times described his work as "a genuine contribution to criminology and journalism alike." Olsen is a two-time winner in the Best Fact Crime category of the Mystery Writer's of America, Edgar award.

Nick Selig excavates the highways to the sky that have been covered up by urban sprawl or dissolved by neglect. More than a guide to landing strips that have had startling second lives as shopping malls or retirement homes, he uncovers the excitement of the early days of air travel, when a man might cling to his job as a lavatory truck driver for a closer peek at aviation. In this follow-up to "Lost Airports of Chicago," discover how a tractor swap gave birth to Clow International Airport and revel in the daredevil exploits of puddle-jumper pilots over the wide-open spaces of Harlem Avenue.

The Time machine is here! Is it even possible?! To travel in time? You don't know how to explain to your kids, your friends, your students what does Time mean ? In this book You will find the answers. The flying car and other inventions.

The book is neither a tale of instruction nor a recommendation regarding flying. It can only be described as an amazing journey taken by an ordinary women. As she had an obvious fear of heights, the book reveals how she was tricked by her flying-loving husband into learning how to fly airplanes! Never in her wildest dreams could she imagine sitting in the left seat of a small airplane, experiencing extreme terror as the plane leaves the ground for the first time. Share the cockpit with her on a solo flight when she encountered powerful winds gusting near forty-five knots that exceeded anything she had encountered, with her instructor aboard. Today, in 2018, we can celebrate with her as she is as comfortable behind the wheel of an automobile as she is in the cockpit of an airplane.

One legendary insect--enormous, white, and exceedingly rare--attracts trout of such size that they couldn't possibly exist in the world as we know it. But in Heywood's classic novel, such things can and do exist. Protagonist Bowie Rhodes, UPI reporter and expert fly fisherman, had learned of the snowfly early in his childhood. It hatches every seven to ten years, never on the same river twice, bringing to rise trout so huge they would have to have lived forty years or more; trout so wily that they never allow themselves to be caught--or even seen; trout so hungry for this fly that they will risk exposure to rise for the hatch. The snowfly is the sacred quest of the most obsessed trout hunters, existing--it seems--only in myth and in a lost manuscript. Rhodes's reporting brings him to such sites as the jungles of Vietnam, the labyrinth of Brezhnev's Soviet Union, and a poisoned Canadian wasteland of uranium mines. His hunt for the manuscript, meanwhile, takes him deep into his own heart of darkness. Richly imaginative and sensual, the world of The Snowfly has more mystery lurking beneath the surface waters than our own. Or does it?

Activities [annual Report]

Trace Elements in Coal and Coal Combustion Residues focuses on trace metal chemistry of coal and coal combustion residues. Special emphasis is placed on management of coal combustion residues in electric power plants and the influence of coal and associated residues on soils, plants, water, and animals. Topics covered include a brief summary of research sponsored by Electric Power Research Institute, environmental pollution from coal combustion plants in low-rainfall regions, accumulation of trace elements in freshwater mussels near a power plant, testing to evaluate fossil fuel wastes by chemicals and isotopes, transport of metals from coal piles and ash impoundments, leachability and toxicity of metals in fly ash, and plant absorption of chemicals from ash. The book will be a useful reference for environmental and reclamation consultants, environmental engineers, toxicologists, environmental regulatory personnel, officials with electric power utilities and water treatment plants, and soil scientists.
