This book integrates the concept of design into the existing framework of industrial performance, international trade and comparative advantage in trade and industrial phenomena, which increasingly have been affected by design characteristics of tradable goods. Design, capability and their evolution are introduced into current theories of trade to explain the reality of international trade in the early twenty-first century and the possibility of design-based comparative advantage is explored. Toward that end, the concepts of design, architecture, organizational capability and productivity are introduced, as are their interactions and evolution. The author starts from the fact that firms ' selection of design locations precedes

that of production locations and that a new product ' s initial production location is usually the same as its design location. In other words, design matters in explaining today ' s trade phenomena. Thus, this book analyzes product design and its evolution in the context of the comparative advantage theory. The author argues that the concept of Ricardo ' s comparative advantage must be reinterpreted in a more dynamic way than in the past, with changing labor input coefficients treated as variables and driven by international capability-building competition between factories. Some of the many topics dealt with in this volume include a capability-architecture view of industrial comparative advantage, a design-based view of manufacturing, the evolution of manufacturing capabilities,

Ricardian comparative advantage with changing labor input coefficients, comparative design cost and selection of design locations and a design process model behind comparative design cost. In this way, the behaviors of factories, product development projects, firms, industries and national economies in today ' s global competition are described and analyzed in the most realistic way.

Hino examines the source of Toyota's strength: the fundamental thinking and management structures that lie beneath the creation of its famed Toyota Production System. From the perspective of a professional with 30 years experience in the auto industry, Hino presents a fresh and detailed analysis of Toyota's essential management system, from its very beginnings into the 21st century. The ultimate goal is not simply to mimic Toyota's formula, but to learn from it and, in doing so, surpass it. From the Translator's Foreword: Unlike most Toyota watchers, Hino urges us to set our sights not on replicating Toyota's success, but on surpassing it. This point is

Plug-in Hybrid Electric Vehicles presents the development of real-time intelligent control systems for plug-in hybrid electric vehicles, which involves control-oriented modelling, controller design, and performance evaluation. The controllers outlined in the book take advantage of advances in vehicle communications technologies, such as global positioning systems, intelligent transportation systems, geographic information systems, and other on-board sensors, in order to provide look-ahead trip data. The book contains simple and efficient models and fast optimization algorithms for the devised controllers to address the challenge of real-time implementation in the design of complex control systems. look-ahead trip information, the authors of the book propose intelligent optimal model-based control systems to minimize the total energy cost, for both grid-derived electricity and fuel. The multilayer intelligent control system proposed consists of trip planning, an ecological cruise controller, and a route-based energy management system. An algorithm that is designed to take advantage of previewed trip information to optimize battery depletion profiles is presented in the book. Different control strategies are compared and ways in which connecting vehicles via vehicle-to-vehicle communication can improve system performance are detailed.
