Elliptic Problem Solvers provides information pertinent to some aspects of the numerical solution of elliptic partial differential equations. This book presents the advances in developing elliptic problem solvers and analyzes their performance. Organized into 40 chapters, this book begins with an overview of the approximate solution of using a standard Galerkin method employing piecewise linear triangular finite elements. This text then defines the types of vector architecture and discusses the variation in performance that can occur on a vector processor as a function of algorithm and implementation.

Other chapters consider the implementation of techniques for elliptical problems. This book discusses as well the six techniques for the solution of nonsymmetric linear systems arising from finite difference discretization of the convection-diffusion equation. The final chapter deals with the basic semiconductor device equations. This book is a valuable resource for electrical and computer engineers, scientists, computer programmers, pure mathematicians, and research workers.

The Metastorm ProVision 6.2 User Guide is the essential reference. Packed with tips and tricks that go way beyond what you would expect, the book explains how to ask the right questions as well as how to use the program. All the new features are described. Bill shares his expertise in many areas including simulation, strategy and process improvement.

This graduate project compares methods in human factors for improving the effectiveness of a consumer user guide in performing common automobile functions. The major methods used during this process included: (1) Heuristic Evaluation (HE); (2) User Testing (UT); and (3) Re-design of a user guide. Three scenarios were selected and were the focus of the HE, UT1, and UT2. During the HE, human factors experts were asked to identify any usability problems in the user guide involving the selected scenarios. In UT1, representative users were asked to complete the scenarios while following the user guide, with performance measured by failures, reported frustration, and time to complete. The user guide was re-designed based on all problems uncovered during HE and UT1 (using human factors principles), and re-tested in UT2 with five different users in order to validate the design changes and compare the performance to UT1. The first hypothesis was HE could identify at least 80% of the usability problems observed in UT1. The second hypothesis was (2) if all usability problems (both HE and UT1) were addressed in a re-design of the user guide, a re-test (UT2) should not introduce new usability problems and would take less time to complete the scenarios. The first hypothesis was supported, showing 93% (10 of 11) of usability problems observed during UT1 were discovered using HE (with the one problem not predicted in UT1 due to experienced frustration). The second hypothesis was not supported, as one new usability problem was introduced during UT2 (two failures for the step) and one previously uncovered problem was not mitigated by the design change (three participants experienced frustration). However, UT2 did show improved performance overall compared to UT1. Also, addressing the HE only problems in the re-design (four total), did not lead to new usability problems for those steps in UT2. This shows that HE can be a trusted method in finding the majority of usability problems

with this system (one that does not require training to use), but re-designs should be verified using a second UT.
